Construction of humanities resource infrastructure in the National Institutes for Humanities

Makoto GOTO

National Museum of Japanese History, Japan

Outline

- Issues of Japanese Large-scale databases in the National Institutes for the Humanities (nihu-INT)
- 2. "khirin" in the National Museum of Japanese History (NMJH)
- 3. Issues of data sharing

nihu-INT

Research Institute for Humanity and Nature

Inter-University Research Institute Corporation National Institutes for the Humanities International Research Center for Japanese Studies

National Museum of Ethnology

Inter-University Research Institute National Institutes

for the Humanities

nihu-INT

- nihu Integrated Retrieval System
 - Started from Apr. 2008, renewed in March 2017
 - http://int.nihu.jp/
- Enable to search a wide variety of databases collectively and encompassing
- Over 6 million records in May 2016
- Objective databases (Feb. 2016): 175
 - NIHU: 146 (Institutes: 138, Bases of area studies: 8)
 - National Diet Library (NDL): 13
 - Center for Integrated Area Studies, Kyoto University: 16 (system cooperation from May 2015)

Database category

By institute, subject, field (6 subjects & 28 fields)

Features

- Very diverse
 - Temporal: From the dawn of humanity to yesterday
 - Spatial: From a local area to the globe
 - Value: From national treasure to a spoon
- 2. Many contents, but not cover the whole of data
 - ≠Google
- 3. Valuable data in the nihu-INT
 - Not find easily

Issues on nihulNT

- These data are not "open." All databases are copyright-protected.
- Impossible to reuse these databases
- Impossible translated into English by researchers outside Japan.
- Most of the information here is either public information, or public domain.
- Therefore, there should be rather little information over which anyone can claim a right. However, for various reasons, many people do make claims to this type of information.

- Much research material in the humanities has been treated as personal property.
- In the past, researchers both from public and private institutions who were engaged in the conservation of material thought of the material they were conserving as their own.

"khirin" (knowledgebase of historical resources in Institutes) in National Museum of Japanese History (NMJH)

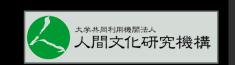

Project of National Museum of Japanese History (NMJH)

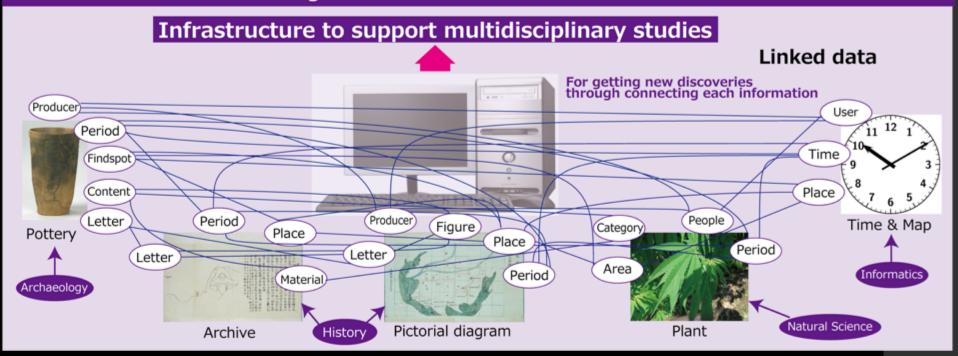

- "Integrated studies of cultural and research resources"
- Enabling access to primary evidence of research results
- Promoting the application of Japanese studies outside Japan
- Enabling backup of resource information in case of disasters.

 Constructing networks of historical and museum resources in universities and museums in Japan
 →Visualizing historical resources in Japan

Unit for Digital Humanities (Renovation of Access Data)

Visualization of Japanese historical resources

- Constructing digital networks of historical resources in universities and museums used through these systems
- The systems was opend in May 2018 → "khirin (knowledgebase of historical research in institutes)"
- "khirin" is an attempt to provide access to historical materials held by universities and museums on their networks as well as to offer data in a stable and sustainable manner in collaboration with the Japan Search.

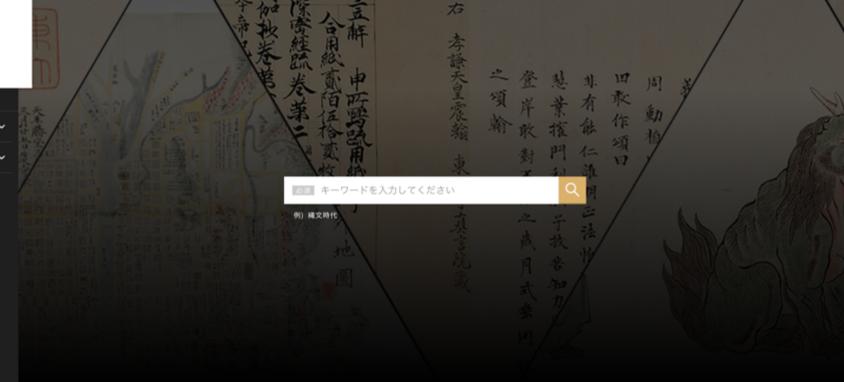

Features of "khirin"

- "khirin" mainly connects mutual links with NMJH's collection catalogues, full-text search, and keywords.
- All the metadata are described in each data source to connect relevant data using RDF in "khirin".
- Using these links, the complexity of plural catalogues can be absorbed.
- Through the SPARQL endpoint, this application allows one to connect resources with anyone worldwide.

Data Sample Rekimin Card

 A card catalogue of historical and folklore surveys conducted by the Agency for Cultural Affairs in Japan between 1972 and 1974, before NMJH's establishment in 1983.

manna wet8 1/ 19 4 manax 越中哲也

The outline of Rekimin cards

- 1. Snapshots indicating resource information in Japan in the first half of the 1970s.
- 2. All cards contain spatial information.
- 3. Cards include temporal information, but its accuracy needs to be verified.
- 4. Some of the cards show resources that were already lost.

A new trend in Japan: "digital archive"

"Digital Archive"

- Since about 2015, there has been a new movement in Japan in a slightly different context from digital humanities.
- A system to systematically and globally transmit various content from Japan is needed.

"Japan Serach" (provisional)

- the idea was originally modeled on "Europeana"
- The "Japan Search" is being developed to realize the aforementioned "Japanese version of Europeana," and a prototype is under development.

Issues

- How we can preserve data for a long period of time under such circumstances.
- Many of the digital archives in Japan are designed only for finding out information, while not much attention is paid to preservation.

Isolation of data and systems

- Systems and data should be isolated.
- And to preserve data for a long period of time, it is essential to use de-facto standard or equivalent data formats so that data formats have a long life-span, which makes migration easy.

Maintaining URLs

- In recent years, the Japanese government ministries changed most of their URLs along with the update of their websites, which became a big problem.
- The National Museum of Japanese History also had to pay the cost of reviewing the setup files, which were difficult to redirect, when it adopted HTTPS.
- Point out again the difficulty of maintaining URLs as a premise of longterm preservation of data.

How we see data download

• By making the overall data available for download in formats easier to understand and keeping it distributed, we can preserve data. No organization deploys data in this manner in reality. To obtain a set of data, we need scraping or some sort of techniques.

Thank you very much
